- L. Euler showed (in 1748)
 - The configuration of a **vibrating string** at some point in time is a **linear combination** of these **normal modes**

- D. Bernoulli argued (in 1753)
 - All physical motions of a **string** could be represented by **linear combinations** of **normal modes**
 - But, he **did not** pursue this mathematically

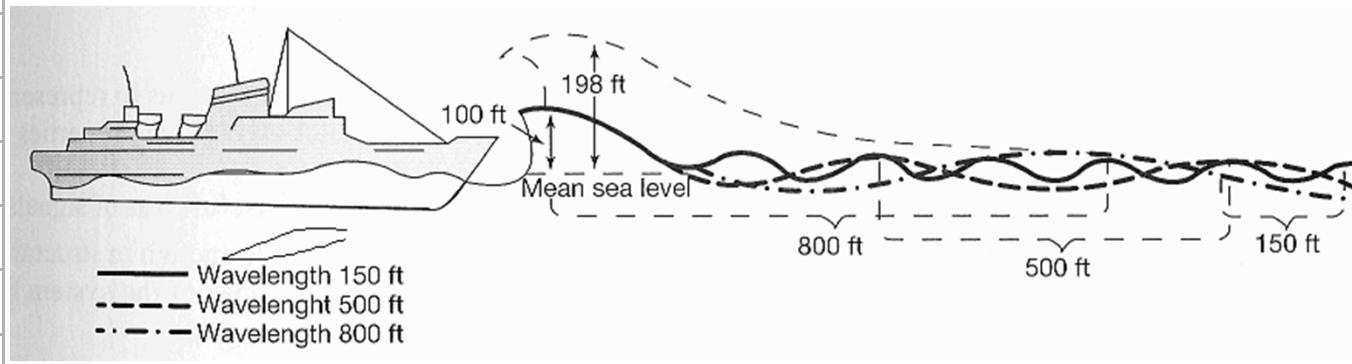

- J.L. Lagrange strongly criticized (in 1759)
 - The use of **trigonometric series** in examination of **vibrating strings**
 - **Impossible** to represent signals with **corners** using **trigonometric series**

- In 1807, Jean Baptiste Joseph Fourier
 - Submitted a paper of using **trigonometric series** to represent “any” periodic signal
 - It is examined by S.F. Lacroix, G. Monge, P.S. de Laplace, and J.L. Lagrange,
 - But **Lagrange rejected it!**

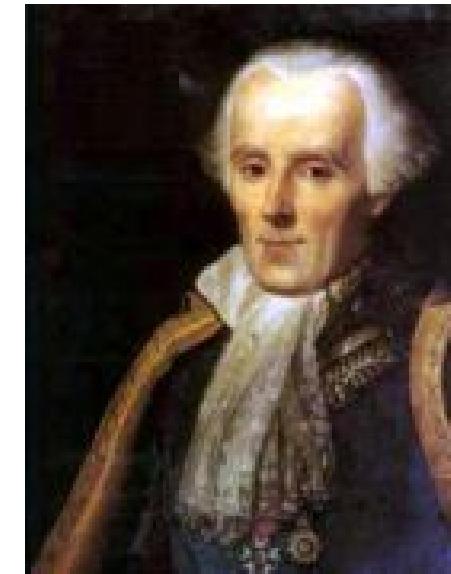

- In 1822, Fourier published a book “**Theorie analytique de la chaleur**”

- Fourier's main contributions:
 - Studied vibration, heat diffusion, etc.
 - Found series of harmonically related sinusoids to be useful in representing the temperature distribution through a body
 - Claimed that “any” periodic signal could be represented by such a series (i.e., Fourier series discussed in Chap 3)
 - Obtained a representation for aperiodic signals (i.e., Fourier integral or transform discussed in Chap 4 & 5)
 - (Fourier did not actually contribute to the mathematical theory of Fourier series)

- Impact from Fourier's work:

- Theory of integration, point-set topology, eigenfunction expansions, etc.
- Motion of planets, periodic behavior of the earth's climate, wave in the ocean, radio & television stations
- Harmonic time series in the 18th & 19th centuries
 - > Gauss etc. on discrete-time signals and systems
- Faster Fourier transform (FFT) in the mid-1960s
 - > Cooley (IBM) & Tukey (Princeton) reinvented in 1965
 - > Can be found in Gauss's notebooks (in 1805)

■ Basic Idea:

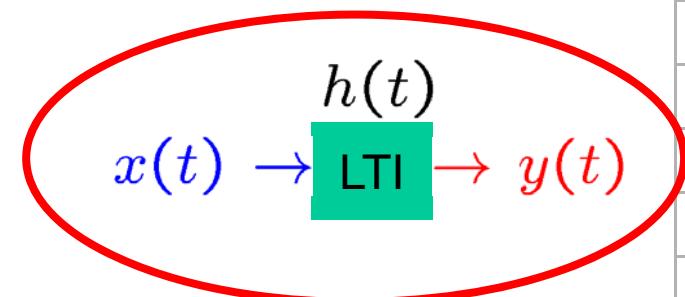

- To represent signals as linear combinations of basic signals

**■ Key Properties:**

1. The set of basic signals can be used to construct a broad and useful class of signals

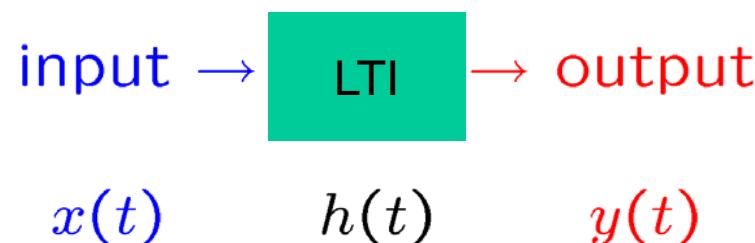

2. The response of an LTI system to each signal should be simple enough in structure to provide us with a convenient representation for the response of the system to any signals constructed as linear combination of basic signals

■ One of Choices:

- The set of **complex exponential signals**

$$\left\{ \begin{array}{l} \text{signals of form } e^{st} \text{ in CT} \\ \text{signals of form } z^n \text{ in DT} \end{array} \right.$$
■ The Response of an LTI System:

$$y(t) = \int_{-\infty}^{+\infty} x(\tau)h(t - \tau)d\tau$$

$$\left\{ \begin{array}{l} \text{CT: } e^{st} \longrightarrow H(s)e^{st} \\ \text{DT: } z^n \longrightarrow H(z)z^n \end{array} \right.$$

eigenfunction
eigenvalue

Let $x(t) = e^{st}$

$$y(t) = \int_{-\infty}^{+\infty} h(\tau) x(t - \tau) d\tau$$

$$= \int_{-\infty}^{+\infty} h(\tau) e^{s(t-\tau)} d\tau$$

$$= e^{st} \int_{-\infty}^{+\infty} h(\tau) e^{-s\tau} d\tau$$

$$\Rightarrow y(t) = H(s)x(t) = H(s)e^{st}$$

$$H(s) = \int_{-\infty}^{+\infty} h(\tau) e^{-s\tau} d\tau$$

Let $x[n] = z^n$

$$y[n] = \sum_{k=-\infty}^{+\infty} h[k]x[n-k]$$

$$= \sum_{k=-\infty}^{+\infty} h[k]z^{n-k}$$

$$= z^n \sum_{k=-\infty}^{+\infty} h[k]z^{-k}$$

$$\Rightarrow y[n] = H(z)x[n] = H(z)z^n$$

$$H(z) = \sum_{k=-\infty}^{+\infty} h[k]z^{-k}$$

- Eigenfunctions and Superposition Properties:

$$e^{s_k t} \xrightarrow{\text{LTI}} H(s_k) e^{s_k t}$$

$$k = 1, 2, 3$$

$$e^{s_1 t} \longrightarrow H(s_1) e^{s_1 t}$$

$$e^{s_2 t} \longrightarrow H(s_2) e^{s_2 t}$$

$$e^{s_3 t} \longrightarrow H(s_3) e^{s_3 t}$$

$$x(t) = a_1 e^{s_1 t} + a_2 e^{s_2 t} + a_3 e^{s_3 t}$$

$$y(t) = a_1 H(s_1) e^{s_1 t} + a_2 H(s_2) e^{s_2 t} + a_3 H(s_3) e^{s_3 t}$$

$$\Rightarrow x(t) = \sum_k a_k e^{s_k t} \longrightarrow y(t) = \sum_k a_k H(s_k) e^{s_k t}$$

$$\Rightarrow x[n] = \sum_k a_k z_k^n \longrightarrow y[n] = \sum_k a_k H(z_k) z_k^n$$

- Harmonically related complex exponentials

$$\phi_k(t) = e^{jk\omega_0 t} = e^{jk\left(\frac{2\pi}{T}\right)t}, \quad k = 0, \pm 1, \pm 2, \dots$$

$$\omega_0 = \frac{2\pi}{T}$$

- The Fourier Series Representation:

$$x(t) = \cdots a_{-2} \phi_{-2}(t) + a_{-1} \phi_{-1}(t) + a_0 \phi_0(t) + a_1 \phi_1(t) + a_2 \phi_2(t) + \dots$$

$$= \sum_{k=-\infty}^{+\infty} a_k \phi_k(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk\omega_0 t} = \sum_{k=-\infty}^{+\infty} a_k e^{jk\left(\frac{2\pi}{T}\right)t}$$

$k = +1, -1$: the first harmonic components
or, the fundamental components

$k = +2, -2$: the second harmonic components

...

etc.

■ Example 3.2:

$$x(t) = \sum_{k=-3}^{+3} a_k e^{jk(2\pi)t}$$

$$a_0 = 1$$

$$a_1 = a_{-1} = \frac{1}{4}$$

$$a_2 = a_{-2} = \frac{1}{2}$$

$$a_3 = a_{-3} = \frac{1}{3}$$

$$\Rightarrow x(t) = 1 + \frac{1}{4}(e^{j2\pi t} + e^{-j2\pi t}) + \frac{1}{2}(e^{j4\pi t} + e^{-j4\pi t})$$

$$+ \frac{1}{3}(e^{j6\pi t} + e^{-j6\pi t})$$

$$\Rightarrow x(t) = 1 + \frac{1}{2} \cos 2\pi t + \cos 4\pi t + \frac{2}{3} \cos 6\pi t$$

$$e^{j\theta} = \cos(\theta) + j\sin(\theta)$$

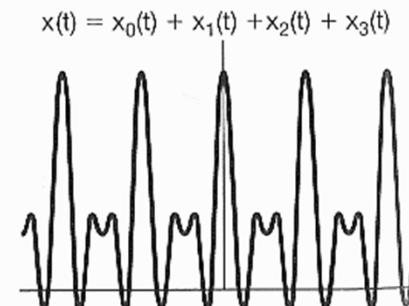

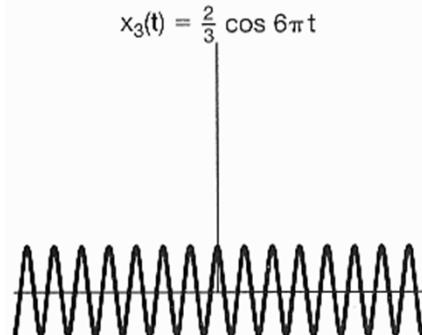

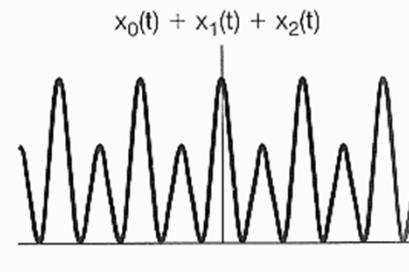

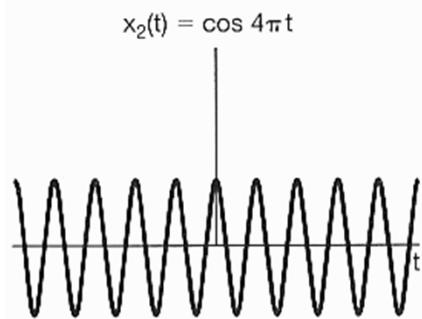

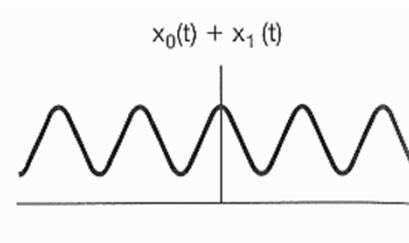

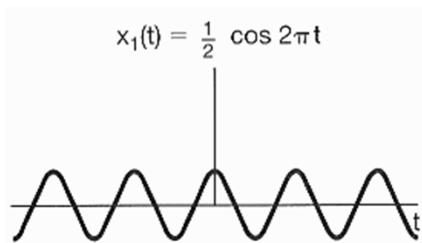

$$\cos(\theta) = \frac{1}{2}(e^{j\theta} + e^{-j\theta})$$

$$\sin(\theta) = \frac{1}{2j}(e^{j\theta} - e^{-j\theta})$$

$$x(t) = 1 + \frac{1}{2} \cos 2\pi t + \cos 4\pi t + \frac{2}{3} \cos 6\pi t$$

■ Procedure of Determining the Coefficients:

$$w_0 = \frac{2\pi}{T}$$

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{j k w_0 t}$$

$$x(t) e^{-j n w_0 t} = \sum_{k=-\infty}^{+\infty} a_k e^{j k w_0 t} e^{-j n w_0 t}$$

$$\int_0^T x(t) e^{-j n w_0 t} dt = \int_0^T \sum_{k=-\infty}^{+\infty} a_k e^{j k w_0 t} e^{-j n w_0 t} dt$$

$$= \sum_{k=-\infty}^{+\infty} a_k \left[\int_0^T e^{j(k-n)w_0 t} dt \right]$$

$$\int_0^T e^{j(k-n)w_0 t} dt = \int_0^T \cos((k-n)w_0 t) dt + j \int_0^T \sin((k-n)w_0 t) dt$$

■ Procedure of Determining the Coefficients:

$$\int_0^T e^{j(k-n)w_0 t} dt = \int_0^T \cos((k-n)w_0 t) dt + j \int_0^T \sin((k-n)w_0 t) dt$$

$$= \begin{cases} T, & k = n \\ 0, & k \neq n \end{cases}$$

$$\Rightarrow \int_0^T x(t)e^{-jnw_0 t} dt = a_n T \quad \Rightarrow \quad a_n = \frac{1}{T} \int_0^T x(t)e^{-jnw_0 t} dt$$

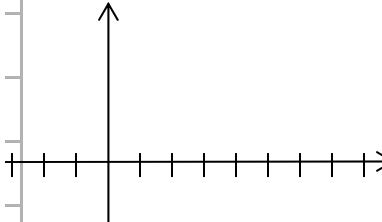

$$\Rightarrow a_k = \frac{1}{T} \int_0^T x(t)e^{-jkw_0 t} dt$$

• Furthermore,

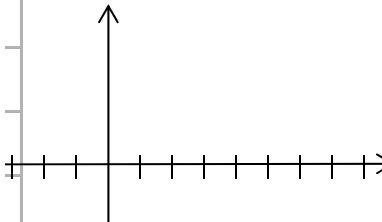

$$\int_T e^{j(k-n)w_0 t} dt = \begin{cases} T, & k = n \\ 0, & k \neq n \end{cases} \quad \Rightarrow \quad a_k = \frac{1}{T} \int_T x(t)e^{-jkw_0 t} dt$$

■ In Summary:

- The **synthesis** equation:

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t} = \sum_{k=-\infty}^{+\infty} a_k e^{jk(2\pi/T)t}$$

- The **analysis** equation:

$$a_k = \frac{1}{T} \int_T x(t) e^{-jkw_0 t} dt = \frac{1}{T} \int_T x(t) e^{-jk(2\pi/T)t} dt$$

- $x(t)$ $\xleftrightarrow{\mathcal{FS}}$ a_k : **CT Fourier series pair**

- $\{a_k\}$: the **Fourier series coefficients**
or the **spectral coefficients** of $x(t)$

- $a_0 = \frac{1}{T} \int_T x(t) dt$, the **dc** or **constant** component of $x(t)$

■ Example 3.4:

$$a_k = \frac{1}{T} \int_T x(t) e^{-jkw_0 t} dt = \frac{1}{T} \int_T x(t) e^{-jk(2\pi/T)t} dt$$

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t} = \sum_{k=-\infty}^{+\infty} a_k e^{jk(2\pi/T)t}$$

$$e^{j\theta} = \cos(\theta) + j\sin(\theta)$$

$$\cos(\theta) = \frac{1}{2}(e^{j\theta} + e^{-j\theta})$$

$$\sin(\theta) = \frac{1}{2j}(e^{j\theta} - e^{-j\theta})$$

$$x(t) = 1 + \sin w_0 t + 2 \cos w_0 t + \cos \left(2w_0 t + \frac{\pi}{4} \right)$$

$$\Rightarrow x(t) = 1 + \frac{1}{2j} [e^{jw_0 t} - e^{-jw_0 t}] + [e^{jw_0 t} + e^{-jw_0 t}]$$

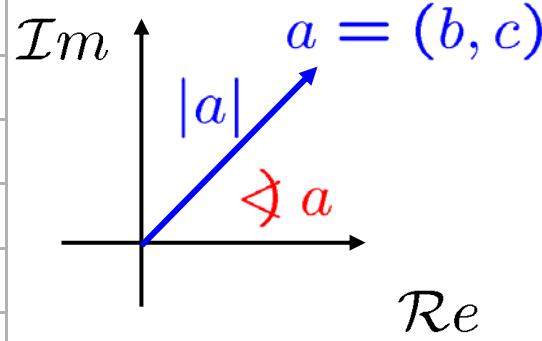

$$+ \frac{1}{2} [e^{j(2w_0 t + \pi/4)} + e^{-j(2w_0 t + \pi/4)}]$$

$$\Rightarrow x(t) = 1 + \left(1 + \frac{1}{2j} \right) e^{jw_0 t} + \left(1 - \frac{1}{2j} \right) e^{-jw_0 t}$$

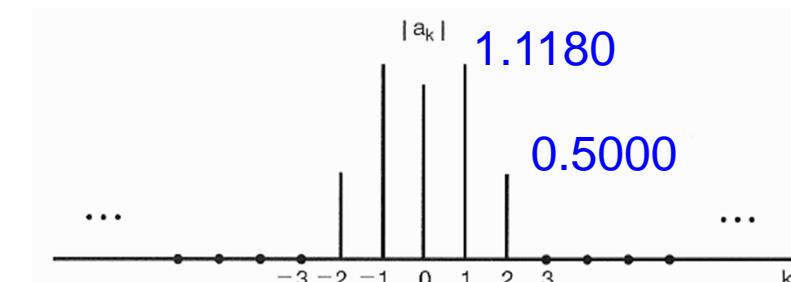

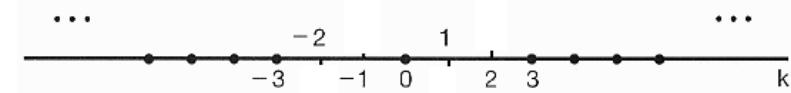

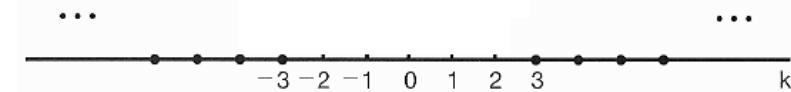

$$+ \left(\frac{1}{2} e^{j(\pi/4)} \right) e^{j2w_0 t} + \left(\frac{1}{2} e^{-j(\pi/4)} \right) e^{-j2w_0 t}$$

■ Example 3.4:

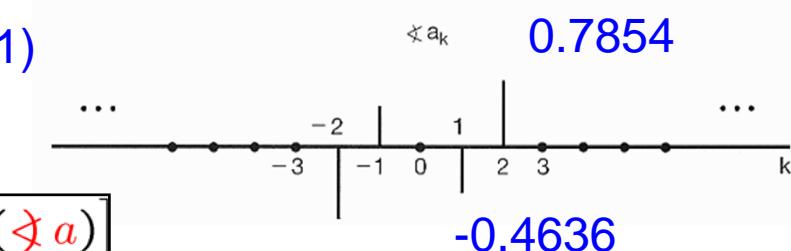

$$\Rightarrow \begin{cases} a_0 = 1, \\ a_1 = \left(1 + \frac{1}{2j}\right) = 1 - \frac{1}{2}j, \\ a_{-1} = \left(1 - \frac{1}{2j}\right) = 1 + \frac{1}{2}j, \\ a_2 = \frac{1}{2}e^{j(\pi/4)} = \frac{\sqrt{2}}{4}(1 + j), \\ a_{-2} = \frac{1}{2}e^{-j(\pi/4)} = \frac{\sqrt{2}}{4}(1 - j), \\ a_k = 0, & |k| > 2. \end{cases}$$

$$\begin{aligned} a &= |a|e^{j\angle a} \\ a &= |a| [\cos(\angle a) + j \sin(\angle a)] \\ a &= b + jc = \sqrt{b^2+c^2} \left[\frac{b}{\sqrt{b^2+c^2}} + j \frac{c}{\sqrt{b^2+c^2}} \right] \end{aligned}$$

■ Fourier Series of Real Periodic Signals:

- If $x(t)$ is **real**, then $x^*(t) = x(t)$

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t}$$

$$\Rightarrow x(t) = x(t)^* = \left(\sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t} \right)^*$$

$$= \sum_{k=-\infty}^{+\infty} a_k^* e^{-jkw_0 t}$$

$$= \sum_{m=+\infty}^{-\infty} a_m^* e^{jmw_0 t}$$

$$= \sum_{k=-\infty}^{+\infty} a_{-k}^* e^{jkw_0 t}$$

$$\Rightarrow a_{-k}^* = a_k \quad \text{or,} \quad a_k^* = a_{-k}$$

$$(a+b)^* = (a^*+b^*)$$

$$(a \times b)^* = (a^* \times b^*)$$

$$m = -k$$

$$k = m$$

■ Alternative Forms of the Fourier Series:

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t}$$

$$\Rightarrow x(t) = a_0 + \sum_{k=1}^{\infty} \left[a_k e^{jkw_0 t} + a_{-k} e^{-jkw_0 t} \right]$$
$$= a_0 + \sum_{k=1}^{\infty} \left[a_k e^{jkw_0 t} + a_k^* e^{-jkw_0 t} \right]$$

$$a_k e^{jkw_0 t} + a_k^* e^{-jkw_0 t} = (R+jI)(C+jS) + (R-jI)(C-jS)$$
$$= (RC-IS) + j(RS+IC) + (RC-IS) - j(RS+IC)$$
$$= 2(RC - IS)$$

$$= a_0 + \sum_{k=1}^{\infty} 2 \operatorname{Re} \left\{ a_k e^{jkw_0 t} \right\}$$

■ Alternative Forms of the Fourier Series:

- If $a_k = A_k e^{j\theta_k}$

$$\Rightarrow x(t) = a_0 + \sum_{k=1}^{\infty} 2 \operatorname{Re} \left\{ A_k e^{j\theta_k} e^{jk\omega_0 t} \right\}$$

$$= a_0 + \sum_{k=1}^{\infty} 2 \operatorname{Re} \left\{ A_k e^{j(k\omega_0 t + \theta_k)} \right\}$$

$$= a_0 + 2 \sum_{k=1}^{\infty} A_k \cos(k\omega_0 t + \theta_k)$$

$$e^{j\theta} = \cos(\theta) + j\sin(\theta)$$

- If $a_k = B_k + j C_k$

$$(a + jb)(c + jd) = (ac - bd) + j(ad + bc)$$

$$C(a + b) = C(a)C(b) - S(a)S(b)$$

$$\Rightarrow x(t) = a_0 + \sum_{k=1}^{\infty} 2 \operatorname{Re} \left\{ (B_k + j C_k) e^{jk\omega_0 t} \right\}$$

$$= a_0 + 2 \sum_{k=1}^{\infty} [B_k \cos(k\omega_0 t) - C_k \sin(k\omega_0 t)]$$

- Fourier maintained that “any” periodic signal could be represented by a Fourier series
- The truth is that Fourier series can be used to represent an extremely large class of periodic signals
- The question is that when a periodic signal $x(t)$ does in fact have a Fourier series representation?

 $x(t)$

$$x_{FS}(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk(2\pi/T)t}$$

$$a_k = \frac{1}{T} \int_T x(t) e^{-jk(2\pi/T)t} dt$$

$$x_N(t) = \sum_{k=-N}^{+N} a_k e^{jk(2\pi/T)t}$$

- One class of periodic signals:
 - Which have finite energy over a single period:

$$\int_T |x(t)|^2 dt < \infty \quad \Rightarrow \quad a_k = \frac{1}{T} \int_T x(t) e^{-jkw_0 t} dt < \infty$$

$$x_N(t) = \sum_{k=-N}^{+N} a_k e^{jkw_0 t}$$

$$e_N(t) = x(t) - x_N(t) \qquad \qquad e(t) = x(t) - \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t}$$

$$E_N(t) = \int_T |e_N(t)|^2 dt \qquad \qquad E(t) = \int_T |e(t)|^2 dt = 0$$

$\rightarrow 0$ as $N \rightarrow \infty$

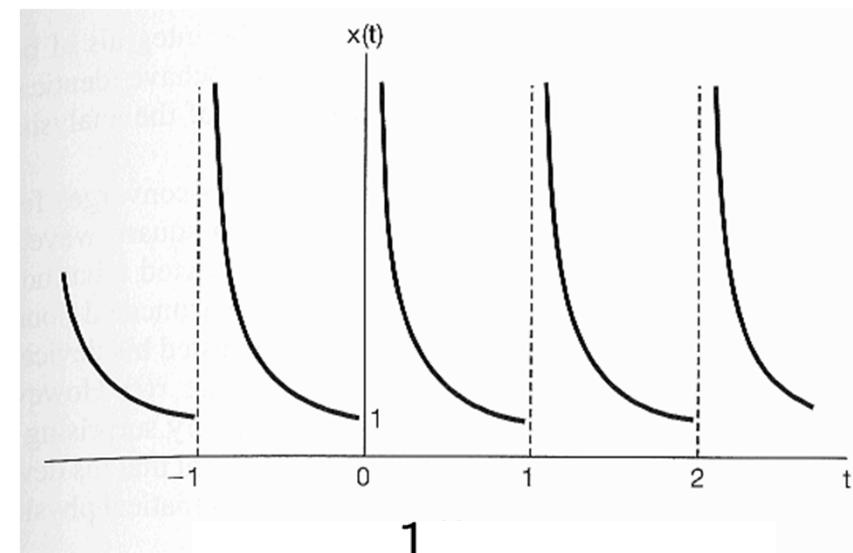

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t}, \quad \forall t ???$$

■ The other class of periodic signals:

- Which satisfy **Dirichlet conditions**:
- **Condition 1:**
 - Over any period, $x(t)$ must be **absolutely integrable**, i.e.,

$$\int_T |x(t)| dt < \infty$$

$$\Rightarrow |a_k| \leq \frac{1}{T} \int_T |x(t) e^{-jk\omega_0 t}| dt \\ = \frac{1}{T} \int_T |x(t)| dt < \infty$$

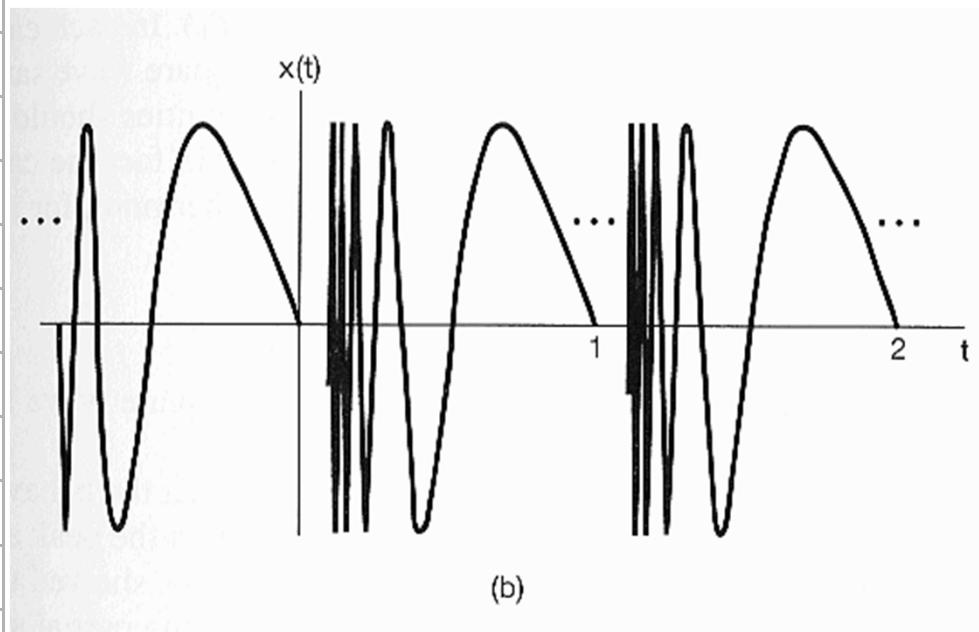

$$x(t) = \frac{1}{t}, \quad 0 < t \leq 1$$

■ The other class of periodic signals:

- Which satisfy **Dirichlet conditions**:
- **Condition 2:**
 - In any finite interval, $x(t)$ is of **bounded variation**; i.e.,
 - There are **no more than a finite number of maxima** and **minima** during any single period of the signal

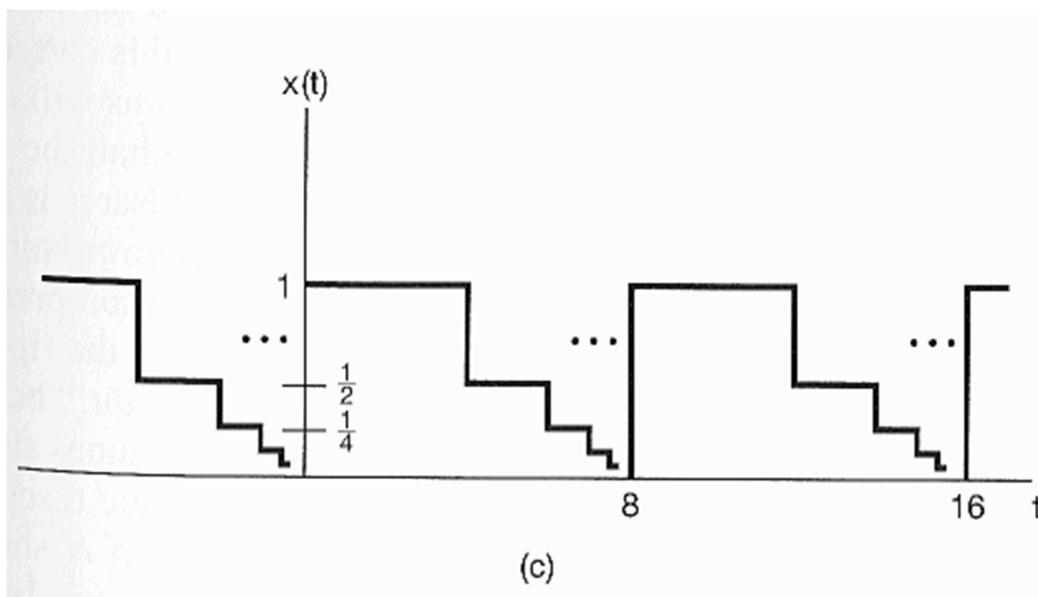

$$x(t) = \sin\left(\frac{2\pi}{t}\right), \quad 0 < t \leq 1$$

$$\int_0^1 |x(t)| dt < 1$$

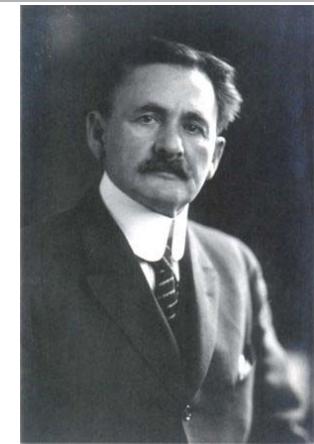

- The other class of periodic signals:

- Which satisfy **Dirichlet conditions**:
 - **Condition 3**:
 - In any finite interval,
 $x(t)$ has only **finite number of discontinuities**.
 - Furthermore, each of these discontinuities is **finite**

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk\omega_0 t}$$

$$a_k = \frac{1}{T} \int_T x(t) e^{-jk\omega_0 t} dt$$

$$\frac{1}{T} \int_T |x(t)|^2 dt = \sum_{k=-\infty}^{+\infty} |a_k|^2$$

Parseval's Relation for Periodic Signals

$$\frac{1}{N} \sum_{n=(N)} |x[n]|^2 = \sum_{k=(N)} |a_k|^2$$

■ In Summary:

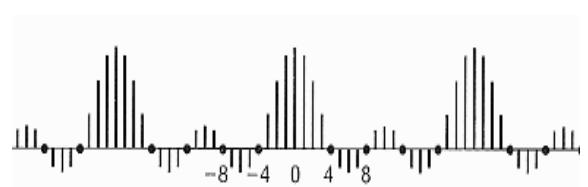

- The **synthesis** equation:

$$x[n] = \sum_{k=<N>} a_k e^{jk\omega_0 n} = \sum_{k=<N>} a_k e^{jk\left(\frac{2\pi}{N}\right)n}$$

- The **analysis** equation:

$$a_k = \frac{1}{N} \sum_{n=<N>} x[n] e^{-jk\omega_0 n} = \frac{1}{N} \sum_{n=<N>} x[n] e^{-jk\left(\frac{2\pi}{N}\right)n}$$

$$a_k = a_{k+N}$$

- $x[n] \xleftrightarrow{\mathcal{FS}} a_k$: DT Fourier series pair

■ Linearity:

- $x[n]$, $y[n]$: periodic signals with period N

$$x[n] \xleftrightarrow{\mathcal{FS}} a_k$$

$$y[n] \xleftrightarrow{\mathcal{FS}} b_k$$

$$\Rightarrow z[n] = A\textcolor{blue}{x}[n] + B\textcolor{red}{y}[n] \xleftrightarrow{\mathcal{FS}} c_k = A\textcolor{blue}{a}_k + B\textcolor{red}{b}_k$$

■ Time Shifting:

$$x[n] \xleftrightarrow{\mathcal{FS}} a_k$$

$$\Rightarrow x[n - n_0] \xleftrightarrow{\mathcal{FS}} e^{-jkw_0 n_0} a_k = e^{-jk\left(\frac{2\pi}{N}\right)n_0} a_k$$

■ Multiplication:

- $x[n], y[n]$: periodic signals with period N

$$x[n] \xleftrightarrow{\mathcal{FS}} a_k$$

$$x[n] = \sum_{l=<N>} a_l e^{j l w_0 n}$$

$$y[n] \xleftrightarrow{\mathcal{FS}} b_k$$

$$y[n] = \sum_{m=<N>} b_m e^{j m w_0 n}$$

$\Rightarrow x[n]y[n]$: also periodic with N

$$x[n]y[n] \xleftrightarrow{\mathcal{FS}} d_k = \sum_{l=<N>} a_l b_{k-l}$$

$$c_k = \sum_{l=-\infty}^{\infty} a_l b_{k-l}$$

\Rightarrow a periodic convolution

■ First Difference:

$$x[n] = \sum_{l=<N>} a_k e^{jk w_0 n}$$

$$x[n] \xleftrightarrow{\mathcal{FS}} a_k$$

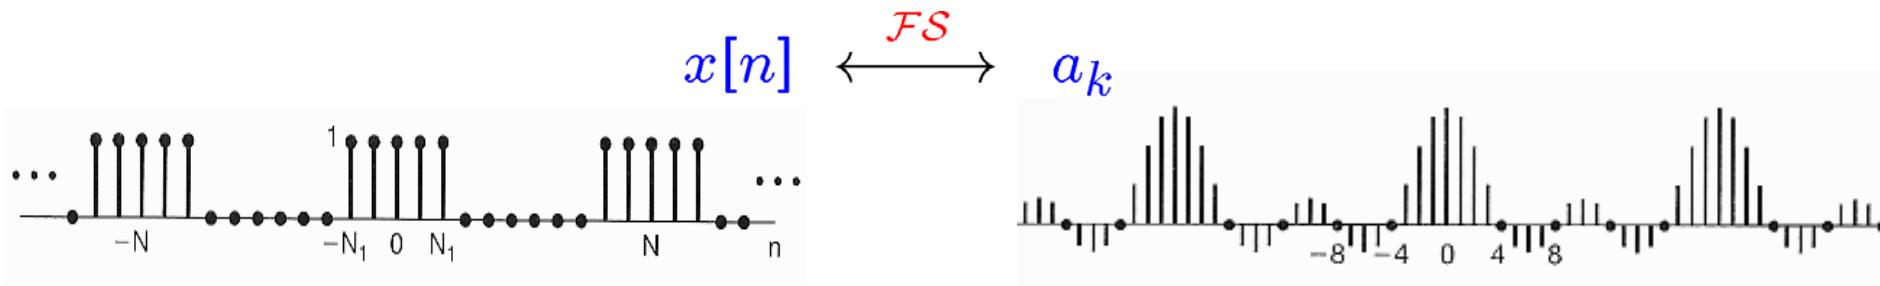

$$\Rightarrow x[n - n_0] \xleftrightarrow{\mathcal{FS}} e^{-j k w_0 n_0} a_k = e^{-j k \left(\frac{2\pi}{N}\right) n_0} a_k$$

$$\Rightarrow x[n - 1] \xleftrightarrow{\mathcal{FS}} e^{-j k w_0} a_k = e^{-j k \left(\frac{2\pi}{N}\right)} a_k$$

$$x[n] - x[n - 1] \xleftrightarrow{\mathcal{FS}} \left(1 - e^{-j k \left(\frac{2\pi}{N}\right)}\right) a_k$$

■ Parseval's relation for DT periodic signals:

- As shown in Problem 3.57:

$$x[n] = \sum_{k=-N}^{N-1} a_k e^{j k w_0 n}$$

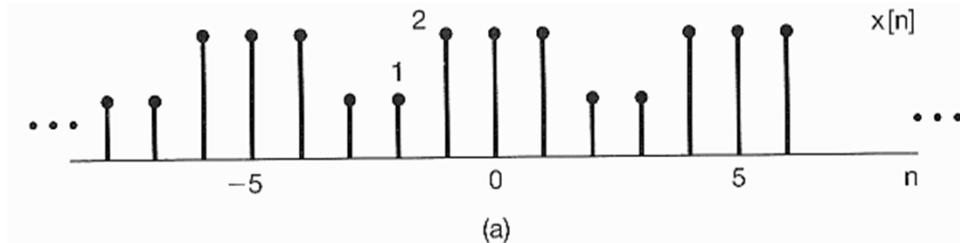

$$a_k = \frac{1}{N} \sum_{n=-N}^{N-1} x[n] e^{-j k w_0 n}$$

$$\frac{1}{N} \sum_{k=-N}^{N-1} |x[n]|^2 = \sum_{k=-N}^{N-1} |a_k|^2$$

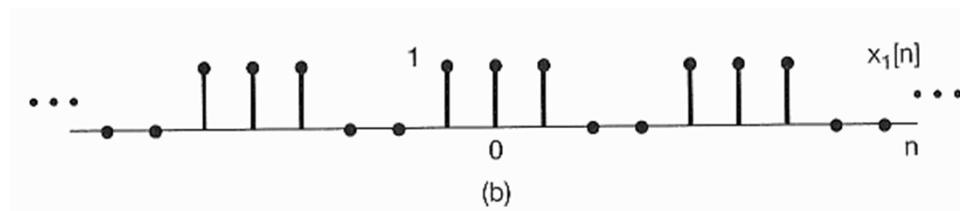

- Parseval's relation states that the total average power in a periodic signal equals the sum of the average powers in all of its harmonic components (only N distinct harmonic components in DT)

■ Example 3.13:

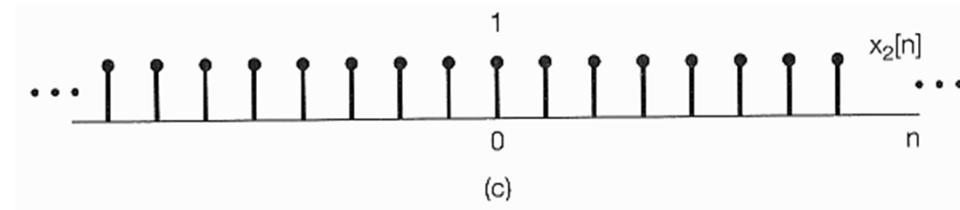

$$a_k = \frac{1}{N} \sum_{n=< N >} x[n] e^{-jkw_0 n}$$

$$x[n] \xleftrightarrow{\mathcal{FS}} a_k$$

$$x_1[n] \xleftrightarrow{\mathcal{FS}} b_k$$

$$x_2[n] \xleftrightarrow{\mathcal{FS}} c_k$$

$$\Rightarrow b_k = \begin{cases} \frac{1}{5} \frac{\sin(3\pi k/5)}{\sin(\pi k/5)}, & \text{for } k \neq 0, \pm 5, \pm 10, \dots \\ \frac{3}{5}, & \text{for } k = 0, \pm 5, \pm 10, \dots \end{cases}$$

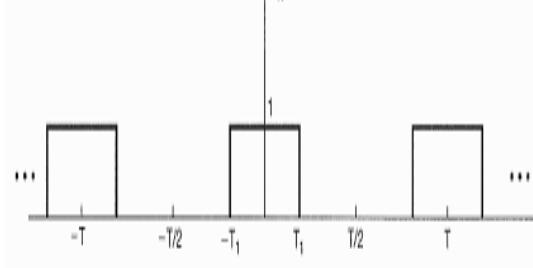

$$x[n] = x_1[n] + x_2[n]$$

$$\Rightarrow c_k = \begin{cases} 0, & \text{for } k \neq 0, \pm 5, \pm 10, \dots \\ 1, & \text{for } k = 0, \pm 5, \pm 10, \dots \end{cases}$$

$$a_k = b_k + c_k$$

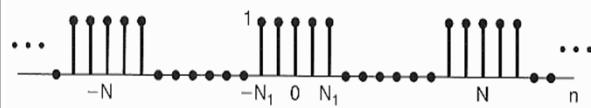

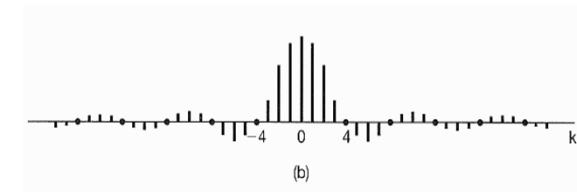

■ CT & DT Fourier Series Representation:

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jkw_0 t}$$

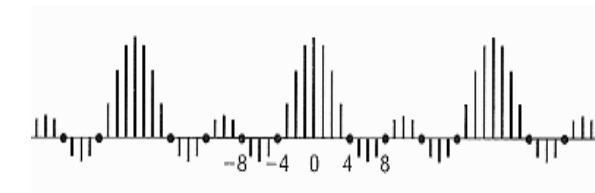

$$a_k = \frac{1}{T} \int_T x(t) e^{-jkw_0 t} dt$$

$$x(t) \xleftrightarrow{\text{CTFS}} a_k$$

$$x[n] \xleftrightarrow{\text{DTFS}} a_k$$

$$x[n] = \sum_{k=-N}^{N} a_k e^{jkw_0 n}$$

$$a_k = \frac{1}{N} \sum_{n=-N}^{N} x[n] e^{-jkw_0 n}$$
